

OpenClaw Business Engineering Hackathon — Participant Guide

February 21st, 2026 | Insightful Offices, Kneza Mihaila 39, Belgrade

Quick Reference

Location	Insightful Offices, Kneza Mihaila 39, Belgrade
Doors open	9:00
Q&A session	9:30
Hackathon starts	10:00 (sharp)
Lunch	13:00
Dinner	19:00
Pencils down	20:00
Presentations	20:00 - ~21:40
Winner announcement	~22:00
Contact on the day	Vukašin 063267943

When You Arrive (9:00 - 10:00)

-
- The entrance to the building is from Uskočka street
- When you enter the building go upstairs,
- <https://maps.app.goo.gl/TVLsovYC5zwGVd7q6>
- Wifi: Insightful - Guest
- You will be able to get a monitor on the spot
- The Q&A session at 9:30 is your chance to ask questions about the challenge before the clock starts.
- **Bring:** Your laptop, charger, and an HDMI adapter if your laptop needs one — you'll present on a TV screen. (We'll have a USBC-HDMI, and the screen has a cast option, however it's always best to have one you're 100% sure works for your machine.)

The Challenge (Recap)

Build a multi-agent claims processing system for **Ohio Mutual Auto** — a fictional mid-size car insurance company.

Their claims process is entirely manual: phone calls, paper forms, blurry photos texted to an agent. Each claim passes through six people before it gets resolved.

The Pipeline

A claim passes through six roles:

1. **Front Desk** — registers and categorizes the claim
2. **Claims Officer** — checks whether coverage applies
3. **Assessor** — estimates the actual damage
4. **Fraud Analyst** — looks for suspicious patterns
5. **Senior Reviewer** — makes the final decision
6. **Finance** — executes payment

The Core Constraint

We're not giving you:

- An access table (what each role can/cannot see)
- Routing rules (when does a claim escalate?)
- A database schema (you design it)
- Pre-made example claims (you decide which edge cases to cover)
- A clear regulatory framework (make reasonable assumptions)

What You Deliver

Two things. Both matter equally.

1. A multi-agent system that processes claims.

A working pipeline built with OpenClaw. Scoped permissions, enforced boundaries, messy real-world input in, payment decision out.

2. An explanation of why it works the way you set it up.

Why does your system make business sense? Why did you give the assessor access to X but not Y? What breaks if you don't compartmentalize? The jury cares as much about your reasoning as your code.

Required Tooling

OpenClaw (aka Moltbot, Clawdbot) must be used for the agent layer. Each role in the pipeline should be an OpenClaw agent with appropriately scoped permissions.

Everything else is open — Cursor, Claude Code, Windsurf, vim, whatever works for you.

If you haven't used OpenClaw before, get familiar before the hackathon. The hackathon isn't the place to learn a new framework from scratch.

On the Day: A Secret Addition

You'll receive an additional piece of the challenge on the day. It adds business context that shapes — and complicates — your design decisions. You will receive it via email on Saturday at 8AM.

Plan for human reasoning: going in, your thinking should not be hardcoded.

Tips for the 10 Hours

- **Research before the hackathon.** Teams that understand how insurance claims actually work will have a real advantage. You can bring knowledge — just not code, text, or any work product.
- **First hour: align on architecture.** Before you write code, agree on what each agent sees, what it doesn't, and why. This is the most important hour.
- **Design the boundaries first.** What information goes where? What's the handoff between roles? Get this right before implementation.
- **Anticipate edge cases.** What if the customer sends only a blurry photo? No police report? A voice memo instead of a written statement? Which edge cases you handle is part of the evaluation.
- **Document your reasoning.** You'll need to explain your trade-offs to the jury. Keep notes on why you made each decision.
- **Don't over-polish the demo.** Brilliant reasoning behind an unfinished system beats a polished one you can't explain.

Presentations (starting at 20:00)

Format

- **5 minutes** to present your work. Strictly timed — we will cut you off at 5:00.
- **5 minutes** of Q&A with the judges.
- Teams present one after another. Order will be announced before presentations begin.

What to Cover in Your 5 Minutes

1. Brief demo: claim goes in, passes through the pipeline, decision comes out.
2. **Focus on the explanation:** What trade-offs did you make? How did you implement them technically? Why do you think that's the right balance?
3. Be ready to show your architecture — where are the boundaries and why?

Practical Details

- You'll present from your own laptop connected to a TV via HDMI or a Cast option.
- Be ready to present your work by 20:00.
- You can present however you want as a part of it is a live demo: the rest can be slides, visuals, architecture diagrams — whatever tells your story best.
- **Test your connection to the presentation screen during the day** so there are no surprises.

Judging Criteria

Each judge scores every team independently. Two criteria, equally weighted:

Business Thinking (50%)

Can you defend decisions from a business perspective? Do you understand why you built what you built? Did you anticipate what could break and why you accepted that risk?

Good sign: "We know our system doesn't catch X and here's why we consciously accepted that."

Red flag: Claims everything works but can't explain how.

System Thinking (50%)

Does it work end-to-end? Is the architecture clean? Does the multi-agent design make sense or is it artificial?

Good sign: Clear boundaries, elegant handoffs, reasoning about why each agent exists.

Red flag: Six agents that are really just one script with artificial divisions.

One Last Thing

Ohio Mutual Auto is fictional. **You own everything you create today.** 100%. No strings. Every system and asset you make is yours — portfolio, clients, job interviews, whatever you want.

Have fun. Build something you're proud of.

See you Saturday.
